1 Introduction

Given the opportunity to review the **USR** design document and related smart contract source code, we in the report outline our systematic approach to evaluate potential security issues in the smart contract implementation, expose possible semantic inconsistencies between smart contract code and design document, and provide additional suggestions or recommendations for improvement. Our results show that the given version of smart contracts can be further improved due to the presence of several issues related to either security or performance. This document outlines our audit results.

1.1 About USR

USDx Savings Rate (USR) is an addition of dForce Protocol that allows any USDx holder to earn risk-free savings. The savings paid out to USDx holders are financed by DIP-001 protocol which deposits constituent stable coins into the decentralized lending market to earn interest.

The basic information of USR is as follows:

Item Description

Issuer dForce Network

Website https://dforce.network/

Type Ethereum Smart Contract

Platform Solidity

Audit Method Whitebox

Latest Audit Report Mar. 24, 2020

1.2 About PeckShield

PeckShield Inc. [24] is a leading blockchain security company with the goal of elevating the security, privacy, and usability of current blockchain ecosystems by offering top-notch, industry-leading services and products (including the service of smart contract auditing). We are reachable at Telegram (https://t.me/peckshield), Twitter (http://twitter.com/peckshield), or Email (contact@peckshield.com).

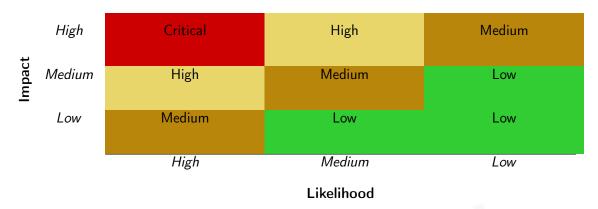

Table 1.2: Vulnerability Severity Classification

1.3 Methodology

To standardize the evaluation, we define the following terminology based on OWASP Risk Rating Methodology [19]:

- <u>Likelihood</u> represents how likely a particular vulnerability is to be uncovered and exploited in the wild;
- Impact measures the technical loss and business damage of a successful attack;
- Severity demonstrates the overall criticality of the risk.

Likelihood and impact are categorized into three ratings: H, M and L, i.e., high, medium and low respectively. Severity is determined by likelihood and impact and can be classified into four categories accordingly, i.e., Critical, High, Medium, Low shown in Table 1.2.

To evaluate the risk, we go through a list of check items and each would be labeled with a severity category. For one check item, if our tool or analysis does not identify any issue, the contract is considered safe regarding the check item. For any discovered issue, we might further

deploy contracts on our private testnet and run tests to confirm the findings. If necessary, we would additionally build a PoC to demonstrate the possibility of exploitation. The concrete list of check items is shown in Table 1.3.

In particular, we perform the audit according to the following procedure:

- <u>Basic Coding Bugs</u>: We first statically analyze given smart contracts with our proprietary static code analyzer for known coding bugs, and then manually verify (reject or confirm) all the issues found by our tool.
- <u>Semantic Consistency Checks</u>: We then manually check the logic of implemented smart contracts and compare with the description in the white paper.
- Advanced DeFi Scrutiny: We further review business logics, examine system operations, and place DeFi-related aspects under scrutiny to uncover possible pitfalls and/or bugs.
- Additional Recommendations: We also provide additional suggestions regarding the coding and development of smart contracts from the perspective of proven programming practices.

To better describe each issue we identified, we categorize the findings with Common Weakness Enumeration (CWE-699) [18], which is a community-developed list of software weakness types to better delineate and organize weaknesses around concepts frequently encountered in software development. Though some categories used in CWE-699 may not be relevant in smart contracts, we use the CWE categories in Table 1.4 to classify our findings.

1.4 Disclaimer

Note that this audit does not give any warranties on finding all possible security issues of the given smart contract(s), i.e., the evaluation result does not guarantee the nonexistence of any further findings of security issues. As one audit cannot be considered comprehensive, we always recommend proceeding with several independent audits and a public bug bounty program to ensure the security of smart contract(s). Last but not least, this security audit should not be used as an investment advice.

Table 1.4: Common Weakness Enumeration (CWE) Classifications Used in This Audit

Category	Summary
Configuration	Weaknesses in this category are typically introduced during
	the configuration of the software.
Data Processing Issues	Weaknesses in this category are typically found in functional-
	ity that processes data.
Numeric Errors	Weaknesses in this category are related to improper calcula-
	tion or conversion of numbers.
Security Features	Weaknesses in this category are concerned with topics like
	authentication, access control, confidentiality, cryptography,
	and privilege management. (Software security is not security
	software.)
Time and State	Weaknesses in this category are related to the improper man-
	agement of time and state in an environment that supports
	simultaneous or near-simultaneous computation by multiple
	systems, processes, or threads.
Error Conditions,	Weaknesses in this category include weaknesses that occur if
Return Values,	a function does not generate the correct return/status code,
Status Codes	or if the application does not handle all possible return/status
	codes that could be generated by a function.
Resource Management	Weaknesses in this category are related to improper manage-
	ment of system resources.
Behavioral Issues	Weaknesses in this category are related to unexpected behav-
	iors from code that an application uses.
Business Logics	Weaknesses in this category identify some of the underlying
	problems that commonly allow attackers to manipulate the
	business logic of an application. Errors in business logic can
	be devastating to an entire application.
Initialization and Cleanup	Weaknesses in this category occur in behaviors that are used
	for initialization and breakdown.
Arguments and Parameters	Weaknesses in this category are related to improper use of
	arguments or parameters within function calls.
Expression Issues	Weaknesses in this category are related to incorrectly written
	expressions within code.
Coding Practices	Weaknesses in this category are related to coding practices
	that are deemed unsafe and increase the chances that an ex-
	ploitable vulnerability will be present in the application. They
	may not directly introduce a vulnerability, but indicate the
	product has not been carefully developed or maintained.

2 | Findings

2.1 Summary

Here is a summary of our findings after analyzing the USR implementation. During the first phase of our audit, we studied the smart contract source code and ran our in-house static code analyzer through the codebase. The purpose here is to statically identify known coding bugs, and then manually verify (reject or confirm) issues reported by our tool. We further manually review business logics, examine system operations, and place DeFi-related aspects under scrutiny to uncover possible pitfalls and/or bugs.

Severity	# of Findings
Critical	0
High	0
Medium	2
Low	2
Informational	7
Total	11

We have so far identified a list of potential issues: some of them involve subtle corner cases that might not be previously thought of, while others refer to unusual interactions among multiple contracts. For each uncovered issue, we have therefore developed test cases for reasoning, reproduction, and/or verification. After further analysis and internal discussion, we determined a few issues of varying severities need to be brought up and paid more attention to, which are categorized in the above table. More information can be found in the next subsection, and the detailed discussions of each of them are in Section 3.

2.2 **Key Findings**

Overall, these smart contracts are well-designed and engineered, though the implementation can be improved by resolving the identified issues (shown in Table 2.1), including 2 medium-severity vulnerability, 2 low-severity vulnerabilities, and 7 informational recommendations.

Table 2.1: Key Audit Findings

ID	Severity	Title	Category	Status

3 Detailed Results

3.1 Missing Address Validation in changeAdmin()

• ID: PVE-001

Severity: Medium

Likelihood: Low

Impact: High

• Target: contracts/USRProxy.sol

Category: Business Logics[15]

• CWE subcategory: CWE-754 [9]

Description

The changeAdmin() function in USRProxy allows the current admin to transfer her privileges to another address. However, inside changeAdmin(), the newAdmin is directly stored into the storage through _setAdmin() after validating the newAdmin is a non-zero address, which is not enough.

Listing 3.1: contracts/USRProxy.sol

As shown in the above code snippets, <code>newAdmin</code> is only validated against the zero address in line 106. However, if you enter a wrong address by mistake, you will never be able to take the management permissions back. Besides, if the <code>newAdmin</code> is the same as the current admin address stored in <code>ADMIN_SLOT</code>, it's a waste of gas.

Recommendation The transition should be managed by the implementation with a two-step approach: changeAdmin() and updateAdmin(). Specifically, the changeAdmin() function keeps the new address in the storage, newAdmin, instead of modifying the ADMIN_SLOT through _setAdmin(). The updateAdmin() function checks whether newAdmin is msg.sender, which means newAdmin signs the transaction and verifies itself as the new admin. After that, newAdmin could be _setAdmin() into ADMIN_SLOT. This had been addressed in the patched contracts/USRProxy.sol.

```
105
         function changeAdmin(address newAdmin) external ifAdmin {
106
             require(_newAdmin != address(0), "Cannot change the admin of a proxy to the zero
                  address");
107
             require( newAdmin != admin(), "The current and new admin cannot be the same.");
108
             require ( newAdmin != newAdmin, "Cannot set the newAdmin of a proxy to the same
109
             newAdmin = newAdmin;
110
             emit AdminChanged( admin(), newAdmin);
111
112
113
         function updateAdmin() external {
114
             require (newAdmin != address(0), "Cannot change the newAdmin of a proxy to the
                 zero address");
115
             require(msg.sender == newAdmin, "msg.sender and newAdmin must be the same.");
             _setAdmin ( newAdmin ) ;
116
117
             emit AdminUpdated( admin());
118
```

Listing 3.2: Revised contracts/USRProxy.sol

3.2 Wrong Function Types

• ID: PVE-002

• Severity: Informational

• Likelihood: None

• Impact: None

• Target: contracts/USR.sol

• Category: Security Features[11]

• CWE subcategory: CWE-269 [5]

Description

The initialize() function in USR is not necessary a public function due to the fact that it is only called once in the constructor().

```
63
64
        st The constructor is used here to ensure that the implementation
65
        * contract is initialized. An uncontrolled implementation
66
        * contract might lead to misleading state
67
        * for users who accidentally interact with it.
68
69
       constructor(string memory _name, string memory _symbol, uint8 _decimals, address
            interestModel, address usdx, uint originationFee, uint maxDebtAmount) public
            {
70
            initialize ( name, symbol, decimals, interestModel, usdx, originationFee,
                maxDebtAmount);
71
       }
72
73
       // --- Init -
```

Listing 3.3: contracts/USR.sol

Recommendation Change the function type of initialize() from public to internal. Since it's an internal function now, we also suggest to rename it to _initialize().

```
63
64
        st The constructor is used here to ensure that the implementation
65
        * contract is initialized. An uncontrolled implementation
66
        * contract might lead to misleading state
67
        * for users who accidentally interact with it.
68
        */
69
       constructor(string memory name, string memory symbol, uint8 decimals, address
            interestModel, address usdx, uint originationFee, uint maxDebtAmount) public
70
            _initialize(_name, _symbol, _decimals, _interestModel, _usdx, _originationFee,
                maxDebtAmount);
71
       }
72
73
       // --- Init ---
74
       function _initialize(string memory _name, string memory _symbol, uint8 _decimals,
            address _interestModel , address _usdx , uint _originationFee , uint _maxDebtAmount
           ) internal {
75
            require(!initialized , "initialize: already initialized.");
            require( originationFee < BASE / 10, "initialize: fee should be less than ten</pre>
               percent.");
            name = name;
```

Listing 3.4: Revised contracts/USR.sol

3.3 Missing takeOut() Function

ID: PVE-003

Severity: Informational

• Likelihood: None

• Impact: None

• Target: contracts/USR.sol

Category:Behavioral Issues [14]

• CWE subcategory: CWE-431 [8]

Description

In the USR design document, the USR contract provides the takeOut() function for the manager to take out some tokens and transfer them to the receiver. However, takeOut() is not implemented in

the code.

Recommendation Implement takeOut() or fix the design document. This had been addressed in the patched contracts/USR.sol by renaming transferOut() to takeOut().

3.4 Excessive Return Statement in transferOut()

• ID: PVE-004

• Severity: Informational

• Likelihood: None

• Impact: None

• Target: contracts/USR.sol

Category: Error Conditions, Return Values, Status Codes [16]

• CWE subcategory: CWE-394 [7]

Description

In USR contract, transferout() is designed to provide the token transfer function for other modules (e.g., DIP001). However, the function always returns true. As shown in line 145, true is returned whether transfer succeed or not, which makes the return code meaningless.

```
135
136
          * @dev Manager function to transfer token out to earn extra savings
137
                but only when the contract is not paused.
138
          * @param _token reserve asset, generally spaking it should be USDx.
139
         * @param _recipient account to receive asset.
140
         \ast @param _amount transfer amount.
141
          * @return bool true=success, otherwise a failure.
142
143
         function transferOut(address token, address recipient, uint amount) external
             onlyManager whenNotPaused returns (bool) {
144
             require(doTransferOut(_token, _recipient, _amount));
145
             return true;
146
```

Listing 3.5: contracts/USR.sol

Recommendation Modify the definition of transferOut() by removing the return statement. This had been addressed in the patched contracts/USR.sol.

```
135
136
         * @dev Manager function to transfer token out to earn extra savings
137
                but only when the contract is not paused.
138
         * Oparam _token reserve asset, generally spaking it should be USDx.
139
         * Oparam _recipient account to receive asset.
140
         * @param _amount transfer amount.
141
         */
142
        function transferOut(address token, address recipient, uint amount) external
            only Manager when Not Paused \{
143
             require(doTransferOut(_token, _recipient, _amount));
```

144 }

Listing 3.6: contracts/USR.sol

3.5 Gas Optimization in drip()

• ID: PVE-005

• Severity: Informational

Likelihood: None

Impact: None

• Target: contracts/USR.sol

• Category:Resource Management [17]

• CWE subcategory: CWE-920 [10]

Description

In USR contract, drip() updates exchangeRate and lastTriggerTime even in the condition of now == lastTriggerTime, which is a waste of gas. Specifically, the drip() function calls rpow() to recalculate the exchangeRate based on the interest rate and time. When now = lastTriggerTime, the result of the rpow() call would be $_usr^0$ which is 1. Therefore, the recalculated exchangeRate would not change after some no-effect code which consumes gas.

```
191
192
         * @dev Savings Rate Accumulation.
         \ast Oreturn the most recent exchange rate, scaled by 1e27.
193
194
195
        function drip() public note returns (uint tmp) {
196
             require(now >= lastTriggerTime, "drip: invalid now.");
197
             uint usr = InterestModel(interestModel).getInterestRate();
198
             tmp = rmul(rpow( usr, now - lastTriggerTime, ONE), exchangeRate);
199
             exchangeRate = tmp;
200
             lastTriggerTime = now;
201
```

Listing 3.7: contracts/USR.sol

```
149
                                           // --- Math ---
150
                                           function rpow(uint x, uint n, uint base) internal pure returns (uint z) {
151
                                                                                    switch x case 0 {switch n case 0 {z := base} default {z := 0}
152
153
                                                                                    default {
                                                                                                        switch mod(n, 2) case 0 { z := base } default { z := x }
154
                                                                                                        let half := div(base, 2) // for rounding.
155
156
                                                                                                        \begin{tabular}{lll} \begin{
157
                                                                                                                             let xx := mul(x, x)
158
                                                                                                                             if iszero(eq(div(xx, x), x)) { revert(0,0) }
159
                                                                                                                             let xxRound := add(xx, half)
                                                                                                                            if It(xxRound, xx) \{ revert(0,0) \}
160
161
                                                                                                                            x := div(xxRound, base)
```

```
162
                           if mod(n,2) {
163
                               let zx := mul(z, x)
                               if and(iszero(iszero(x)), iszero(eq(div(zx, x), z)))  revert
164
165
                               let zxRound := add(zx, half)
166
                               if It(zxRound, zx) \{ revert(0,0) \}
167
                               z := div(z \times Round, base)
168
                           }
                      }
169
170
                  }
171
             }
172
```

Listing 3.8: contracts/USR.sol

Recommendation Change now >= lastTriggerTime to now > lastTriggerTime. In addition, we noticed all callers check now > lastTriggerTime before calling drip() due to the fact that drip() may revert when now < lastTriggerTime which breaks the business logic. Therefore, we suggest to replace the require() statement into an if-else check. This way, the callers no longer need to know the logic inside drip() and the function would not revert when it is called at a wrong time. According to the patched USR.sol, this had been addressed.

```
191
192
          * @dev Savings Rate Accumulation.
193
          * Oreturn the most recent exchange rate, scaled by 1e27.
194
          */
195
          function drip() public note returns (uint) {
196
             if (now > lastTriggerTime){
197
                 tmp = rmul(rpow(interestRate, now - lastTriggerTime, ONE), exchangeRate);
198
                 exchangeRate = _tmp;
199
                 lastTriggerTime = now;
200
                 return tmp;
201
             }
202
             return exchangeRate;
203
```

Listing 3.9: contracts/USR.sol

3.6 approve()/transferFrom() Race Condition

ID: PVE-006

Severity: Low

Likelihood: Low

• Impact: Medium

• Target: contracts/USR.sol

• Category: Time and State [12]

• CWE subcategory: CWE-362 [6]

Description

There is a known race condition issue regarding approve()/transferFrom() [2]. Specifically, when a user intends to reduce the allowed spending amount previously approved from, say, 10 USR to 1 USR. The previously approved spender might race to transfer the amount you initially approved (the 10 USR) and then additionally spend the new amount you just approved (1 USR). This breaks the user's intention of restricting the spender to the new amount (1 USR), not the sum of old amount and new amount (11 USR).

```
function approve(address _spender, uint _wad) external returns (bool) {

allowance[msg.sender][_spender] = _wad;

emit Approval(msg.sender, _spender, _wad);

return true;

}
```

Listing 3.10: contracts/USR.sol

Recommendation Add additional sanity checks in approve().

```
function approve(address _ spender, uint _wad) external returns (bool) {
    require((_wad == 0) (allowed[msg.sender][_spender] == 0));
    allowance[msg.sender][_spender] = _wad;
    emit Approval(msg.sender, _spender, _wad);
    return true;
}
```

Listing 3.11: contracts/USR.sol

3.7 Wrong Variable Name

• ID: PVE-007

• Severity: Informational

Likelihood: None

• Impact: None

• Target: contracts/USR.sol

• Category: Bad Coding Practices [13]

• CWE subcategory: CWE-1099 [3]

Description

In USR contract, equity() could be used to retrieve the current contract debts. However, the variable _banance for keeping the balance of USDx is spelled wrong.

```
uint _totalAmount = rmul(totalSupply, getExchangeRate());
uint _banance = IERC20(usdx).balanceOf(address(this));
if (_totalAmount > _banance)
    return -1 * int(_totalAmount.sub(_banance));

return int(_banance.sub(_totalAmount));
}
```

Listing 3.12: contracts/USR.sol

Recommendation Rename the variable _banance to _balance. This had been addressed in the patched contracts/USR.sol.

```
289
290
         * @dev Get current contract debet.
291
         * @return int > 0 indicates no debts,
292
                   otherwise in debt, and it indicates lossing amount, scaled by 1e18.
293
294
        function equity() external view returns (int) {
295
             uint totalAmount = rmul(totalSupply, getExchangeRate());
296
             uint balance = IERC20(usdx).balanceOf(address(this));
297
             if ( totalAmount > balance)
                 return -1 * int( totalAmount.sub( balance));
298
299
300
             return int(_balance.sub(_totalAmount));
301
```

Listing 3.13: contracts/USR.sol

3.8 Flawed Fee Calculation

• ID: PVE-008

Severity: Low

Likelihood: Low

Impact: Low

• Target: contracts/USR.sol

Category: Business Logics[15]

CWE subcategory:

Description

In draw() and exit(), we noticed that originationFee is used to calculate the amount that the user needs to pay for management fee. However, USR does not consider the time keeping the user's digital assets in fee calculation. Instead, only a portion of USDx or USR tokens are kept as an one-time payment when the user is withdrawing USDx out.

Recommendation It's common to implement a time-based management fee mechanism. People make profits based on time. They should pay more fee when they make more profits (i.e., putting money in USR for a longer time).

3.9 Missing Drip in setInterestRate()

• ID: PVE-009

• Severity: Medium

Likelihood: LowImpact: Medium

• Target: contracts/InterestModel.sol

• Category:

• CWE subcategory:

Description

In USR, the exchangeRate is the global variable which represents the amount of USDx required to exchange for one USR token. For example, when an user pays in 100 USDx, $\frac{100}{exchangeRate}$ of USR tokens would be minted and transferred to the user. Since the system pays interest to users based on time, the exchangeRate keeps increasing by $exchangeRate \times (interestRate)^t$ where t represents number of seconds since the USR smart contract is initialized (drip() function). However, the interestRate could be updated by setInterestRate(), which results in wrong exchangeRate calculation.

For example, someone calls $\mathtt{drip}()$ at the t=100 and the t=106 respectively. If the interestRate is not updated during 100 < t < 106, $exchangeRate_{106}$ should be $exchangeRate_{100} \times (interestRate)^6$. If interestRate is updated to $interestRate_{NEW}$ at t=105, the current implementation generates $exchangeRate_{106} = exchangeRate_{100} \times (interestRate_{NEW})^6$. But, based on the business logic, $exchangeRate_{106}$ should be $exchangeRate_{100} \times (interestRate)^5 \times (interestRate_{NEW})$.

Recommendation Call drip() before updating interestRate. In the patches, this issue had be resolved and its remove the interface InterestModel.

3.10 Missing Assertion Messages

ID: PVE-010

Severity: Informational

• Likelihood: None

Impact: None

• Target: contracts/USRProxy.sol

• Category: Bad Coding Practices [13]

• CWE subcategory: CWE-1113 [4]

Description

In upgradeToAndCall(), the require statement in line 118 does not provide enough information (i.e., no assertion message).

```
function upgradeToAndCall(address newImplementation, bytes calldata data) payable
external ifAdmin {
    upgradeTo(newImplementation);
```

```
117          (bool success,) = address(this).call.value(msg.value)(data);
118          require(success);
119          // require(address(this).call.value(msg.value)(data));
120    }
```

Listing 3.14: contracts/USRProxy.sol

Recommendation Add assertion messages. This had been addressed in the patched contracts /USRProxy.sol.

Listing 3.15: contracts/USRProxy.sol

3.11 Missing Owner Check in transferOwnership()

• ID: PVE-011

Severity: Informational

Likelihood: None

Impact: None

- Target: contracts/library/Ownable.sol
- Category:Resource Management [17]
- CWE subcategory: CWE-920 [10]

Description

In Ownable contract, the transferOwnership() function does not validate the _newOwner against the pendingOwner, which is a waste of gas.

```
/**

* @dev Transfers ownership of the contract to a new account ('newOwner_').

* Can only be called by the current owner.

*/

function transferOwnership(address _newOwner) external onlyOwner {
    require(_newOwner != owner, "transferOwnership: the same owner.");
    pendingOwner = _newOwner;
}
```

Listing 3.16: contracts / library / Ownable.sol

Recommendation Ensure that the parameter, _newOwner, is not equal to pendingOwner. This had been addressed in the patched contracts/Ownable.sol.

```
/**

* @dev Transfers ownership of the contract to a new account ('newOwner_').
```

```
* Can only be called by the current owner.

*/

function transferOwnership(address _newOwner) external onlyOwner {
    require(_newOwner != owner, "transferOwnership: the same owner.");
    require(_newOwner != pendingOwner, "transferOwnership: the same pendingOwner.")
    ;

pendingOwner = _newOwner;
}
```

Listing 3.17: contracts / library / Ownable.sol

3.12 Other Suggestions

Due to the fact that compiler upgrades might bring unexpected compatibility or inter-version consistencies, it is always suggested to use fixed compiler versions whenever possible. As an example, we highly encourage to explicitly indicate the Solidity compiler version, e.g., pragma solidity 0.5.12; instead of pragma solidity ^0.5.12;.

In addition, there is a known compiler issue that in all 0.5.x solidity prior to Solidity 0.5.17. Specifically, a private function can be overridden in a derived contract by a private function of the same name and types. Fortunately, there is no overriding issue in this code, but we still recommend using Solidity 0.5.17 or above.

Moreover, we strongly suggest not to use experimental Solidity features or third-party unaudited libraries. If necessary, refactor current code base to only use stable features or trusted libraries. In case there is an absolute need of leveraging experimental features or integrating external libraries, make necessary contingency plans.

4 Conclusion

In this audit, we thoroughly analyzed the USR documentation and implementation. The audited system does involve various intricacies in both design and implementation. The current code base is well organized and those identified issues are promptly confirmed and fixed.

Meanwhile, we need to emphasize that smart contracts as a whole are still in an early, but exciting stage of development. To improve this report, we greatly appreciate any constructive feedbacks or suggestions, on our methodology, audit findings, or potential gaps in scope/coverage.

5 Appendix

5.1 Basic Coding Bugs

5.1.1 Constructor Mismatch

- Description: Whether the contract name and its constructor are not identical to each other.
- Result: Not found
- Severity: Critical

5.1.2 Ownership Takeover

- Description: Whether the set owner function is not protected.
- Result: Not found
- Severity: Critical

5.1.3 Redundant Fallback Function

- Description: Whether the contract has a redundant fallback function.
- Result: Not found
- Severity: Critical

5.1.4 Overflows & Underflows

- Description: Whether the contract has general overflow or underflow vulnerabilities [20, 21, 22, 23, 25].
- Result: Not found
- Severity: Critical

5.1.5 Reentrancy

- <u>Description</u>: Reentrancy [26] is an issue when code can call back into your contract and change state, such as withdrawing ETHs.
- Result: Not found
- Severity: Critical

5.1.6 Money-Giving Bug

- Description: Whether the contract returns funds to an arbitrary address.
- Result: Not found
- Severity: High

5.1.7 Blackhole

- Description: Whether the contract locks ETH indefinitely: merely in without out.
- Result: Not found
- Severity: High

5.1.8 Unauthorized Self-Destruct

- Description: Whether the contract can be killed by any arbitrary address.
- Result: Not found
- Severity: Medium

5.1.9 Revert DoS

- Description: Whether the contract is vulnerable to DoS attack because of unexpected revert.
- Result: Not found
- Severity: Medium

5.1.10 Unchecked External Call

• Description: Whether the contract has any external call without checking the return value.

• Result: Not found

• Severity: Medium

5.1.11 Gasless Send

• Description: Whether the contract is vulnerable to gasless send.

• Result: Not found

• Severity: Medium

5.1.12 Send Instead Of Transfer

• Description: Whether the contract uses send instead of transfer.

• Result: Not found

• Severity: Medium

5.1.13 Costly Loop

• <u>Description</u>: Whether the contract has any costly loop which may lead to Out-Of-Gas exception.

• Result: Not found

• Severity: Medium

5.1.14 (Unsafe) Use Of Untrusted Libraries

• Description: Whether the contract use any suspicious libraries.

• Result: Not found

• Severity: Medium

5.1.15 (Unsafe) Use Of Predictable Variables

• <u>Description</u>: Whether the contract contains any randomness variable, but its value can be predicated.

• Result: Not found

• Severity: Medium

5.1.16 Transaction Ordering Dependence

• Description: Whether the final state of the contract depends on the order of the transactions.

• Result: Not found

• Severity: Medium

5.1.17 Deprecated Uses

• Description: Whether the contract use the deprecated tx.origin to perform the authorization.

• Result: Not found

• Severity: Medium

5.2 Semantic Consistency Checks

• <u>Description</u>: Whether the semantic of the white paper is different from the implementation of the contract.

• Result: Not found

• Severity: Critical

5.3 Additional Recommendations

5.3.1 Avoid Use of Variadic Byte Array

• <u>Description</u>: Use fixed-size byte array is better than that of byte[], as the latter is a waste of space.

• Result: Not found

• Severity: Low

5.3.2 Make Visibility Level Explicit

• Description: Assign explicit visibility specifiers for functions and state variables.

• Result: Not found

• Severity: Low

5.3.3 Make Type Inference Explicit

• <u>Description</u>: Do not use keyword var to specify the type, i.e., it asks the compiler to deduce the type, which is not safe especially in a loop.

• Result: Not found

Severity: Low

5.3.4 Adhere To Function Declaration Strictly

• <u>Description</u>: Solidity compiler (version 0.4.23) enforces strict ABI length checks for return data from calls() [1], which may break the the execution if the function implementation does NOT follow its declaration (e.g., no return in implementing transfer() of ERC20 tokens).

Result: Not found

• Severity: Low
